USER'S GUIDE

Dylan's World Art Show

New art by living artists from around the world, a new piece every 60 seconds. On your computer it fills two screens: the art on the left, and its story on the right. On an iPad it's a home-screen app that works in portrait and landscape.

- **Art made by hand or on a computer:** paintings, drawings, watercolors, prints, collages and digital art. No photography, no photos of objects, no AI-made images, no fan art or video game art.
- **New work:** made in 2010 or later, by artists alive today.
- **Travels the world:** each piece is picked by country first. The same artist doesn't come back until hundreds of others have had a turn, and pieces don't repeat.
- **Same frame every time:** each piece is shown whole, never cropped, and the space around it is filled with a soft, blurred copy of the piece.
- **Bottom right (iPad):** the artist, their country, the title and year, and the link to the piece at its source.
- **Always fresh:** GitHub rebuilds the art list every 3 hours, and the show loads the newest list every time it opens.

The show: **https://dylaneinsidler.github.io/World-Art-Show/**

On the computer

Right-click `install.ps1` > **Run with PowerShell**. This puts a **World Art Show** shortcut on your Desktop. Double-click it and the show fills both monitors (on one monitor, the two screens stack). Needs Google Chrome or Microsoft Edge.

- **Left screen: the art,** a new piece every minute, whole and as large as it fits.
- **Right screen: everything about it.** The title, artist and year; what it's made of and how big it is; **the story** behind it (the museum's own words, or the artist's own description on DeviantArt); **the artist** (their Wikipedia biography and photo for museum artists, or their DeviantArt profile); **their country** on a world map, with its flag, capital, region, languages and a short introduction; and **where it came from**: the museum and city (with a line on the map from the artist's country to the museum), or when it was shared on DeviantArt. Long text scrolls slowly by itself while the piece is up. Along the bottom: the link to the piece and the time until the next one.

◀ ❚❚ ▶ on the right screen, or ← **Space** →	previous piece, pause / resume, next piece
☀ **Light** / ☾ **Dark** on the right screen	switches both screens; it's remembered for next time
Digital art: Off / On on the right screen	only the museums' paintings, drawings and prints (Off, the usual), or DeviantArt's digital art too; remembered
✕ in the top right corner of either screen, or **Esc**	closes both screens

The screens stay on for up to 4 hours while it's open. It runs from a copy in `AppData\Local\WorldArtShow\app` that `start.ps1` refreshes from this folder on every start, so edit the files here, not the copy. The two screens talk through a tiny web server that `launch.ps1` runs and only this PC can reach (`http://localhost:47233`); it also looks up DeviantArt pieces for the right screen with your DeviantArt key (below), so it never leaves the PC. `country-facts.js` (capitals, regions, languages) is made by `tools/make_country_facts.py`.

On the iPad

1. Open **https://dylaneinsidler.github.io/World-Art-Show/** in Safari.
2. Tap the **Share** button > **Add to Home Screen** > **Add**.
3. Open **World Art Show** from the home screen. It runs full screen and keeps the screen awake. Held sideways it shows landscape pieces; held upright, portrait pieces (near-square pieces show both ways). Turn it and a piece that no longer fits is replaced.

Swipe left for the next piece, swipe right to go back, tap to pause.

On both: tap or click the link under a piece to open its page at the museum or on DeviantArt. While the show is minimized, covered or in the background, it waits, so each piece gets its full minute on screen.

Where the art comes from

- Art Institute of Chicago (USA)
- Minneapolis Institute of Art (USA)
- SMK – National Gallery of Denmark (Denmark)
- DeviantArt: the pieces its staff pick each day (Daily Deviations), plus the last 12 months of new work by those artists (each one's gallery is checked every few days), once a key is set up (below). Judged by each piece's tags: only pieces tagged as painted, drawn or made digitally, and not photographs, AI-made images, fan art, video game or pixel art, crafts, or character-sale posts.

Museum artists need a recorded birth year, no recorded death, and a birth year of 1925 or later. Museums can take years to record a death, so each one is also checked against Wikidata (matching name and birth year). Pieces whose only picture isn't the artwork itself (a photo of the gallery room) can be listed in `tools/leave_out.txt`.

Setting up DeviantArt

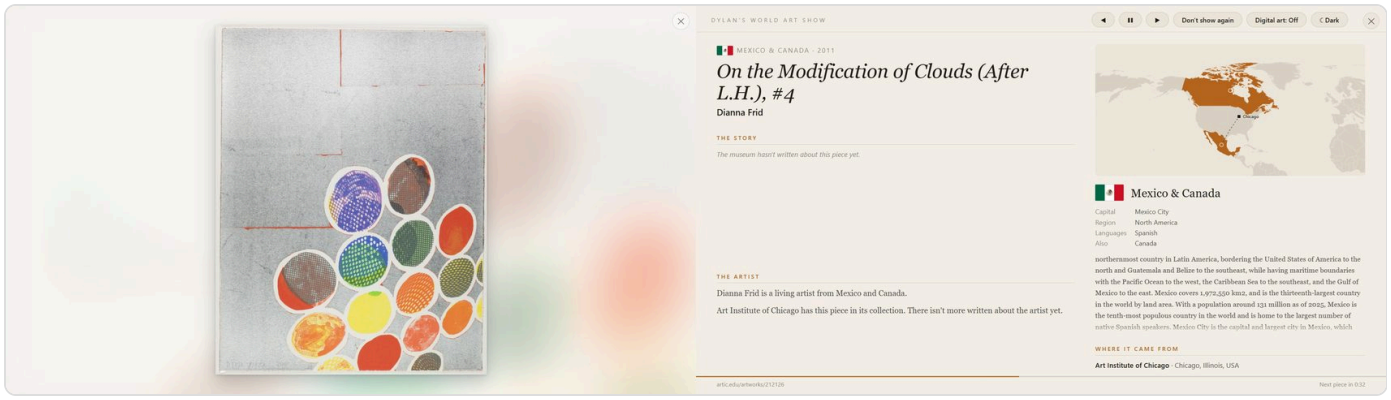

DeviantArt needs a free developer key, and it blocks requests from GitHub's servers, so the PC collects its picks and sends them up:

1. Sign in at deviantart.com (free account), then go to deviantart.com/developers > **Register your Application**.
2. Fill in a title (World Art Show) and a description, set **OAuth2 Grant Type** to *Client Credentials*, put `https://dylaneinsidler.github.io/World-Art-Show/` in the redirect and original URL whitelists, agree to the terms and save.
3. Run `install.ps1` (if you haven't), then open `%LOCALAPPDATA%\WorldArtShow\deviantart-key.txt` in Notepad, replace the two "paste ..." parts with your **client_id** and **client_secret**, and save.

From then on the PC collects DeviantArt's newest picks when the show opens (at most every 6 hours) and once a day at 9 AM (or as soon as the PC is on after that), and sends them to GitHub, which adds them to the show. What it did is logged in `%LOCALAPPDATA%\WorldArtShow\deviantart.log`.

> If something on the screen ever looks wrong, ask Claude about this app by name: everything it needs to know is in the app's folder, *Dylan's World Art Show*.

What changed lately

2.10 (October 23, 2026)

- **The art shows up right away, every time.** On October 23 the National Gallery of Denmark's picture server stopped answering, and the show waited 40 seconds on each of its pieces before trying another. The Morning and Night Screens and the iPad's cycler open the show fresh for each turn, so a turn could end on "Getting the newest art..." with no art at all. Now:
- it tries three pieces from three different museums at once and shows whichever arrives first;
- it gives up on a picture after 15 seconds, and a museum whose server doesn't answer is skipped for three hours, remembered from one opening to the next;
- the next piece, already loaded during a turn, is the first piece of the next turn, so it appears in under a second.
- **The Art Institute of Chicago's art shows on the PC again.** Chicago turns away picture requests from a page on this computer, which is how the PC and the Screens run the show, so its 300-odd pieces never appeared there. The show now asks for pictures without saying which page wants them.
- Pictures of each version are taken with the shared picture tool now (`tools ake-screenshots.ps1`).

2.9 (October 11, 2026)

- **On the iPad and iPhone, swipe up for the details:** what the piece is and what it's about, the artist (born, where from, a short biography), a small map from the artist's country to where the piece is now, and the museum that has it (on view or not). It's hidden until you swipe up (or tap "Details" at the bottom left); swipe it down, or tap the art, to hide it again. While it's open the piece stays put. Swiping left and right still changes the piece.
- Not on the iPad yet: it goes up when you say so.

2.8 (October 10, 2026)

- **Both screens appear together**: each window now opens straight at full size on its own monitor (no small window jumping to full screen), and both stay dark for a moment and then appear at the same time.
- **Its own icon in the Windows taskbar** while it's open, instead of Chrome's.
